Banach Space Complexes (Mathematics and Its Applications) C.-G. Ambrozie, Florian-Horia Vasilescu
The aim of this work is to initiate a systematic study of those properties of Banach space complexes that are stable under certain perturbations. A Banach space complex is essentially an object of the form $\dots \rightarrow X_{p-1} \xrightarrow{O_{p-1}} X_p \xrightarrow{O_p} X_{p+1} \rightarrow \dots$, where p runs a finite or infinite interval of integers, X_p are Banach spaces, and $O_p : X_p \rightarrow X_{p+1}$ are continuous linear operators such that $O_p O_{p-1} = 0$ for all indices p . In particular, every continuous linear operator $S : X \rightarrow Y$, where X, Y are Banach spaces, may be regarded as a complex: $0 \rightarrow X \xrightarrow{S} Y \rightarrow 0$. The already existing Fredholm theory for linear operators suggested the possibility to extend its concepts and methods to the study of Banach space complexes. The basic stability properties valid for (semi-) Fredholm operators have their counterparts in the more general context of Banach space complexes. We have in mind especially the stability of the index (i.e., the extended Euler characteristic) under small or compact perturbations, but other related stability results can also be successfully extended. Banach (or Hilbert) space complexes have penetrated the functional analysis from at least two apparently disjoint directions. A first direction is related to the multivariable spectral theory in the sense of J. L.
